Number each pointer change in execution order, and cross out any old connection you replace.

Singly linked lists

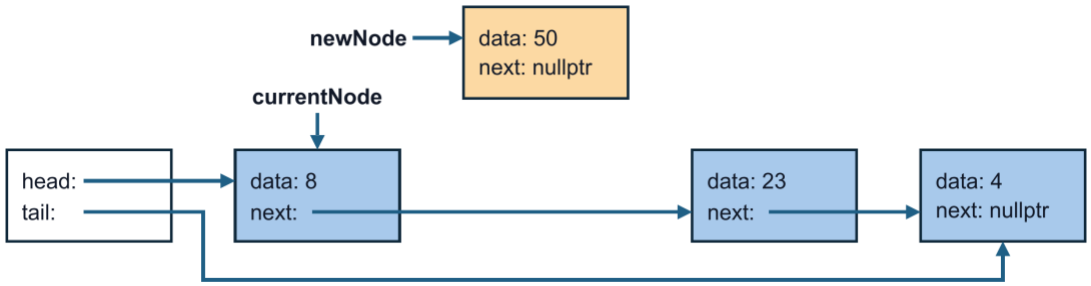

1. Call `Append(newNode)`, where newNode holds 37.

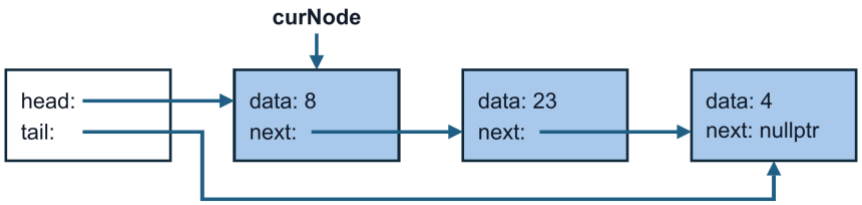

2. Call `Prepend(newNode)`, where newNode holds 5.

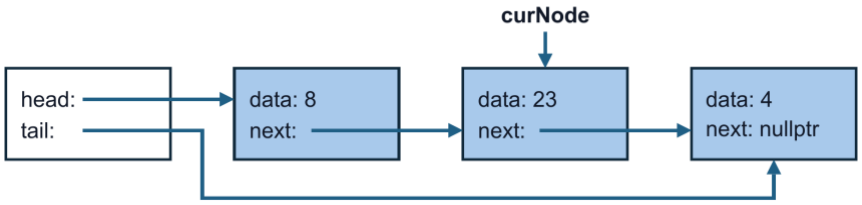

3. Call `InsertAfter(currentNode, newNode)`, where currentNode points to 8 and newNode holds 50.

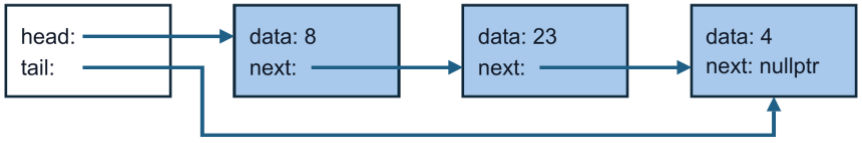

4. Call `RemoveAfter(curNode)`, where curNode points to 8.

5. Call `RemoveAfter(curNode)`, where curNode points to 23.

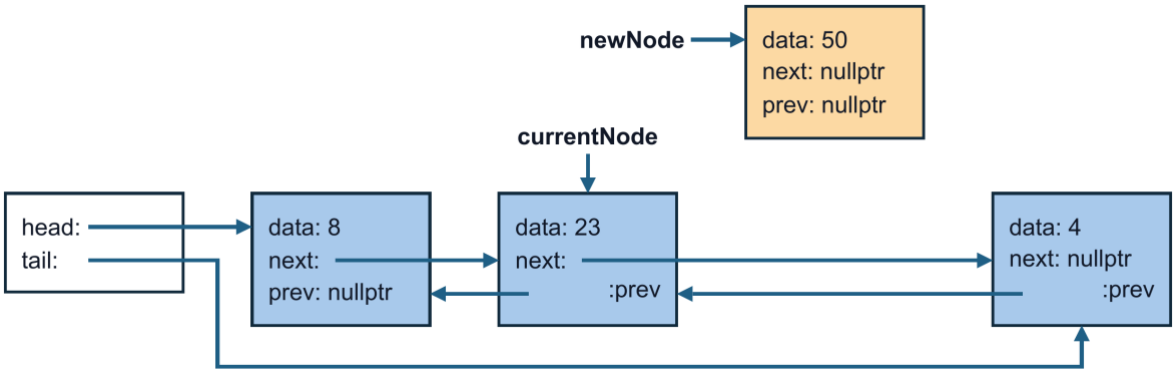

6. Call RemoveValue(23). Trace curNode and prevNode until the loop stops, then finish the call.

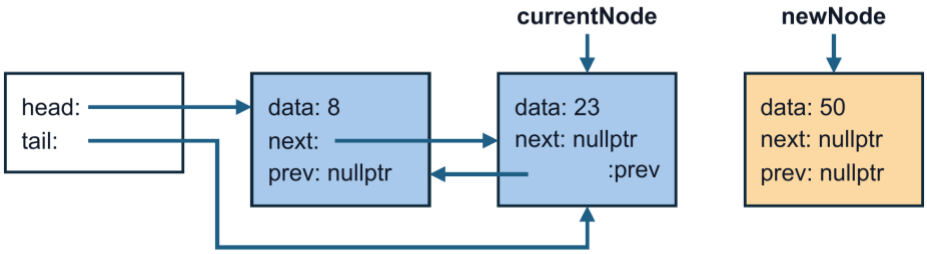

Doubly linked lists

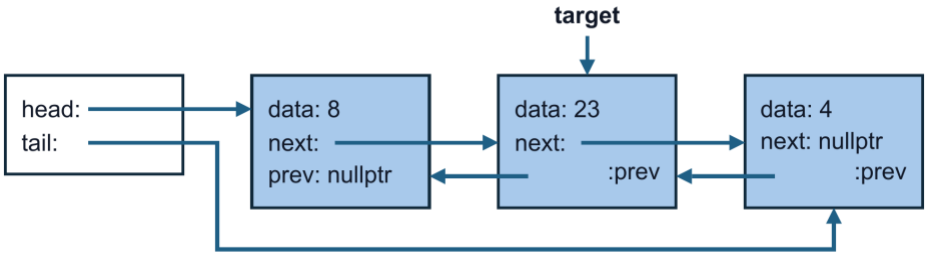

7. Call `InsertAfter(currentNode, newNode)`, where currentNode points to 23 and newNode holds 50. Update both next and prev pointers.

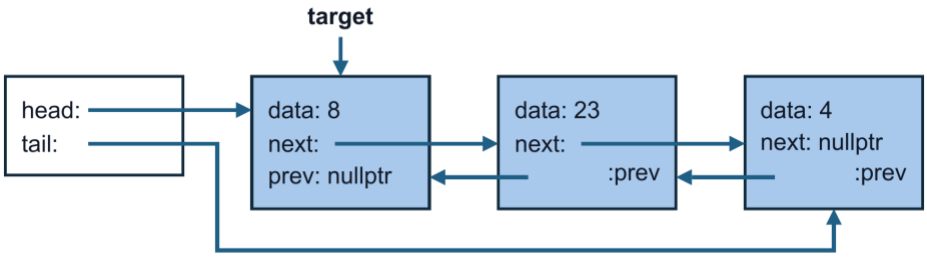

8. Call `InsertAfter(currentNode, newNode)`, where currentNode points to 23 and newNode holds 50. Update both next and prev pointers.

9. Call `RemoveNode(target)`, where target points to 23.

10. Call `RemoveNode(target)`, where target points to 8.

11. Call `RemoveNode(target)`, where target points to 4.
